

Discussion

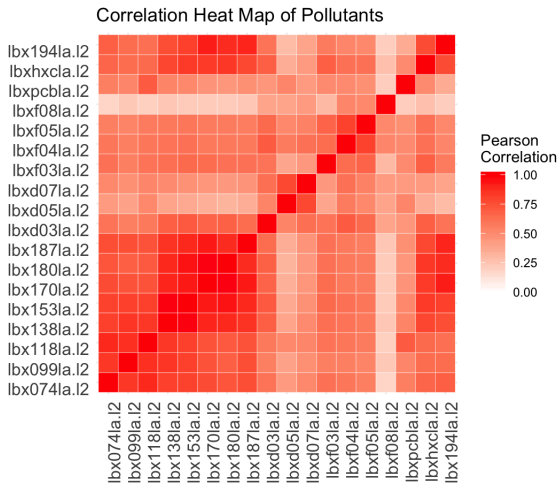

08.24.2018

Overall Categories of Methods Covered

- ① Dimensionality reduction
 - PCA, clustering, WQS
- ② Empirical (data-driven) variable selection
 - Lasso etc, BKMR
- ③ Regularization (penalization) or shrinkage
 - Lasso etc, BKMR, WQS

Summary of Results

Results from Mitro et al paper

Percent difference (95% CI) in leukocyte telomere length per doubling of exposure (Model 2)

Metric	% Difference (95% CI)
Non-dioxin-like PCBs	3.80 (0.80, 6.90)
Non-ortho PCBs	4.31 (2.76, 5.88)
TEQ	5.76 (2.27, 9.37)

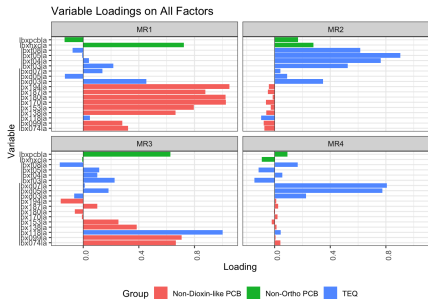

Clustering

*Points indicate population means

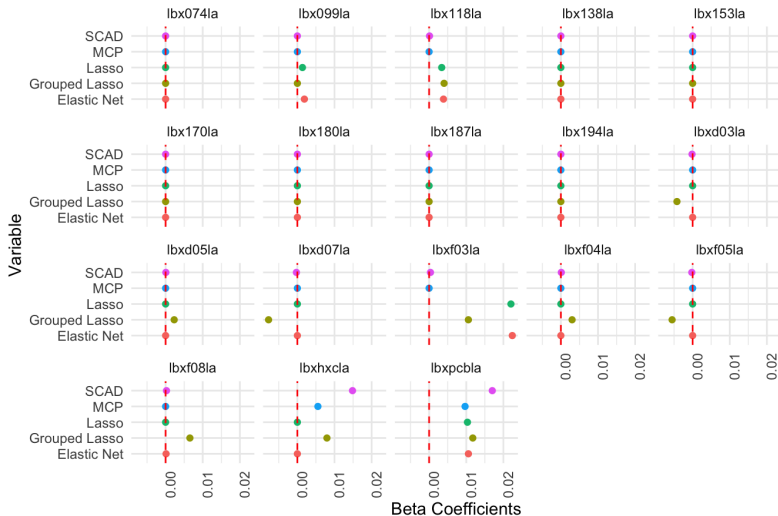

Factor Analysis

Variable Selection

Variable Selection Coefficients

Constrained WQS

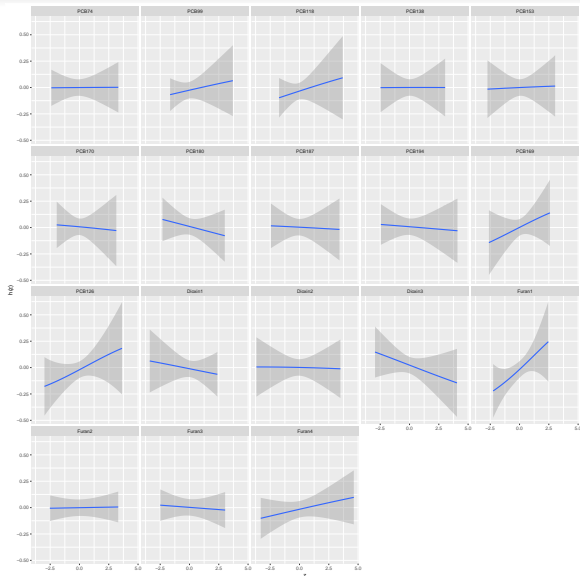

$$\beta_{cWQS} (95\% \text{ CI}) = 0.019 (0.008, 0.029)$$

Posterior Inclusion Probabilities

Variable	Group	Group PIP	Cond. PIP
PCB74	Non-dioxin-like PCBs	0.39	0.08
PCB99			0.13
PCB118			0.21
PCB138			0.10
PCB153			0.11
PCB170			0.13
PCB180			0.09
PCB187			0.07
PCB194			0.08
PCB169	Non-Ortho PCBs	0.56	0.34
PCB126			0.66
Dioxin1	Dioxins	0.26	0.41
Dioxin2			0.27
Dioxin3			0.32
Furan1	Furans	0.88	0.94
Furan2			0.01
Furan3			0.02
Furan4			0.02

BKMR (cont'd)

LBXHXCLA:	PCB-169
LBXPCBLA:	PCB-126
LBXF03LA:	Furan 1
LBXD07LA:	Dioxin 3

★★Some evidence for interactions for Furan 1
